

PROJECT ANALYSIS REPORT: PropInsight - Real Estate Analytics Platform

1. System Architecture Overview

PropInsight is built on the **Laravel 11** PHP framework, following the **Model-View-Controller (MVC)** architectural pattern. The system is designed for high maintainability, separating business logic (Controllers), data structure (Models), and the user interface (Blade Templates).

- **Backend:** PHP 8.2+ with Laravel.
- **Database:** MySQL/MariaDB utilizing Eloquent ORM for relationship management.
- **Frontend:** Blade Templating Engine, Bootstrap 5.3, and Custom CSS3.
- **Workflow:** Request → Routing → Middleware (CSRF) → Controller → Model → View.

2. Backend Workflow & Routing

The application uses a centralized routing structure (`routes/web.php`) that maps HTTP requests to specific controller methods.

Controller	Responsibility
HomeController	Manages the landing page and featured property retrieval.
PropertyController	Handles inventory listings, search/filtering, and property details.
CalculatorController	Processes mortgage and ROI calculations using financial formulas.
CompareController	Manages user-selected property comparisons using Laravel Sessions.
PageController	Handles auxiliary pages like the Interactive Location Map.

3. Database Design & Models

The data layer is normalized into several key tables managed via **Eloquent Relationships**:

3.1 Core Models

- **City:** One-to-Many relationship with Properties. Stores names and slugs.
- **PropertyType:** One-to-Many relationship with Properties (e.g., Residential, Commercial).
- **Property:** The central entity containing price, area, and bedroom/bathroom attributes.
 - `belongsTo(City)`
 - `belongsTo(PropertyType)`

3.2 Schema Management

- **Migrations:** Version-controlled schema management with foreign key constraints.
- **Seeding:** Automated population of market data via `seed_data.php`.

4. Feature Modules

4.1 Dynamic Property Inventory

- **Logic:** Implements a robust query builder that handles Search keywords, City slugs, Type slugs, and Price Range (Min/Max).
- **Performance:** Uses Eloquent's `with()` eager loading to prevent N+1 query issues.
- **UX:** Integrated Laravel pagination for smooth navigation through large datasets.

4.2 Property Comparison Matrix

- **Mechanism:** A 3-slot system stored in the **Laravel Session**.
- **Selection:** Dynamic dropdowns populated directly from the database allow for precise side-by-side analysis.
- **Persistence:** Selections persist across browser refreshes until explicitly cleared.

4.3 Investment Calculator

- **Formula:** Implements a standard Mortgage/EMI formula.
- **Localized Logic:** Configured for Pakistan-specific KIBOR rates and loan tenures (up to 25 years).
- **ROI Analysis:** Projects annual rental yield and 5-year appreciation.

4.4 Image Fallback System

- **Fallback Strategy:** Checks for custom images; defaults to a deterministic rotation of verified placeholders (`p1.jpg`, `p2.jpg`, etc.) based on the Property ID.

5. Frontend & Blade Layout System

The project implements a **DRY (Don't Repeat Yourself)** approach using a Master Layout.

- **Master Layout:** `layouts/app.blade.php` (Global Navbar, Ticker, Footer).
- **Active Navigation:** Uses `Route::is()` to dynamically highlight the current menu item.
- **Inheritance:** Child views utilize `@extends` and `@section` to inject page-specific content.

6. Validation & Security

6.1 Validation Rules

- **Price Range:** `max_price` must be `gt:min_price` (validated server-side).
- **Calculator:** Strict numeric constraints and range limits (Tenure: 1-25 years).
- **Lead Gen:** Mandatory fields with email format verification.

6.2 Security Measures

- **CSRF Protection:** All POST requests are protected via the `@csrf` directive.
- **SQL Injection:** Prevented through Eloquent's built-in parameter binding.
- **XSS Protection:** Blade's `{{ }}` syntax automatically escapes malicious output.

7. Refactoring & Optimization

The project underwent a significant stabilization phase to reach production standards:

- **Code Consolidation:** Merged 6+ duplicate HTML structures into a single Layout file.
 - **Architectural Cleanup:** Moved all logic from Route closures into dedicated Controllers.
 - **Data Liquidation:** Replaced 100% of static/hardcoded values with dynamic Eloquent bindings.
-

8. Roadmap & Improvements

- **User Auth:** Implement Login/Register for saved property lists.
 - **Live Data:** Connect the Market Ticker to a real-time financial API.
 - **Admin Panel:** Create a CRUD interface for property management.
-

9. Conclusion

PropInsight is a robust, data-driven application demonstrating professional Laravel implementation. By combining strict validation, efficient relationships, and a component-based frontend, the platform provides a scalable solution for real estate analytics in the Pakistani market.
